LANDSAT Follow-on Investigation #22510  
Type II Progress Report #7  
Three Months Ending 1 December 1976

The Use of LANDSAT DCS and Imagery  
in Reservoir Management and Operation

Principal Investigator  
Mr. Saul Cooper  
New England Division  
Corps of Engineers  
Waltham, Mass. 02154

# 1. ACCOMPLISHMENTS

DCS - The LANDSAT DCS and NED's Ground Receive Station have continued to perform up to expectations. The NED computerized automatic tracking operation has operated faultlessly for over two months, but data collection was interrupted for three days due to an RF cable working loose inside the tracking pedestal (service charges to find the malfunction amounted to \$484.55).

A site list showing the latest placement of DCP's is attached (Figure 1). Several new features have been introduced to our DCS investigation. The Cold Regions Research and Engineering Laboratory (CRREL) developed new snow pillow interfaces for our use in northern Maine and their use in North Dakota. These devices were installed in September and October, and began transmitting with ID numbers 7147, 7325 and 7103-7105.

In a cooperative venture involving NED, CRREL, and the University of Maine, a complex temperature sensing DCP has been installed on Sugarloaf Mountain, Kingfield, Maine. The platform (designed by Blanchard Pratt of CRREL) consists of a chain of 27 thermocouples arranged in four banks, a multiplexing interface, an electrical temperature compensating circuit to obviate an absolute reference temperature, a LCBarge convertible DCP (ID 7125), and a Ball antenna. Power is supplied by batteries and a charger to

(E77-10130) THE USE OF LANDSAT DCS AND  
IMAGERY IN RESERVOIR MANAGEMENT AND  
OPERATION Progress Report, period ending 1  
Dec. 1976 (Corps of Engineers, Waltham,  
Mass.) 8 p HC A02/MF A01  
CSCL 08H G3/43

convert 120 volt AC. A program for decoding the thermocouple data was written at NED, and a copy of the program (TCDECODE) and a sample of its output are attached (Figures 2 and 3).

A second revision of the manual entitled: "Operation of LANDSAT Automatic Tracking System", written by Timothy D. Buckelew has been prepared. Although originally intended for inhouse use, the manual has been requested by several outside agencies as well. The manual provides complete instructions for tracking LANDSAT, managing computer data files, routine operation and troubleshooting associated with NED's ground receive station.

A DCP (ID 7101) that serves a dual purpose has been installed in NED's communications computer room. It is used as a demonstration set for the many visitors who view the system, and serves as a working spare for field placement. The set consists of a LaBarge convertible DCP, a tipping-bucket rain gage, a Leupold-Stevens ADR, a Solarex solar panel with associated charging regulator, and Gel-cel batteries.

b. Imagery - Work continues on schedule on the imagery aspect of this investigation as outlined in past progress reports. Selected CCT scenes for test sites in the Saint John watershed in Maine are being analyzed on the GISS computer to define snow radiance values, with the final aim of estimating snow water equivalence. Results will be presented in the Type III final report, scheduled for April 1977.

## 2. MAJOR PROBLEMS

a. DCS - Twice during this quarter ATT service failed, and communication on the NASCOM to NED teletype was interrupted for several days both times, as circuits had been left open by local service personnel.

The two snow pillows deployed by NED have not been transmitting valid data. The one in Maine is beyond repair for the winter due to remoteness of the site.

b. Imagery - No major problems.

## 3. SIGNIFICANT RESULTS

a. DCS - Recently we reviewed the performance history of all DCP's placed in the field, and the summary shows that DCP's are very reliable.

Figure 4 depicts the life history of data collection platforms that have been placed at remote locations in New England from 1972 to the present. This data has been compiled from field technician's records to assess the reliability of DCP's. Available records include the duty cycle (sometimes intermittent) of 23 DCP's over a span of approximately four years for a total service history of 70.1 DCP-years. During this time several events could force a visit to the DCP site: Initial installation, repair, preventive maintenance, battery change, or vandalism. For this analysis, final removal was not defined as a forced visit since removal was not urgent in most cases. Over the 70.1 DCP-years there were about 95 forced visits for an average of approximately 1.4 forced visits per DCP-year. In other words, on an average slightly under nine months elapsed between two forced visits to the same DCP.

Note that our early experience (or inexperience) with DCP's is included in this analysis, so it may be assumed that for us or another experienced group to start now with the knowledge gained would involve far fewer DCP failures and on the average assure nine months or more between forced visits.

#### 4. MEETINGS AND VISITORS

On 15 October 1976, Alan Flanders of the National Weather Service in Silver Spring, Maryland, visited NED to view our ground receive station and promote data exchange between NED and the River Forecast Center in Bloomfield, Connecticut.

On 19-20 October 1976, Mr. Timothy Buckelew of NED and Dr. Harlan McKim and Ms. Carolyn Merry of CRREL attended a command briefing before a panel of discipline specialists at NASA-GSFC.

#### 5. RECOMMENDATIONS

None stemming from this quarter's activities.

#### 6. FUTURE PLANS

All personnel at NED or CRREL engaged in this Follow-on Investigation are now preparing the Type III final report due in April 1977. The present document will be the last Type II progress report to be issued as the final report is so close at hand.

Plans are underway for a new DEP application to transmit important water quality data from the Saint John and Allagash Rivers in northern Maine to NED by LANDSAT DCS. The water quality in that region is now being monitored in connection with the proposed Dickey-Lincoln School power dams to be constructed in Maine. Most of the equipment needed to accomplish the data transmission is on hand, and an attempt will be made to interface DCP's to existing USGS equipment prior to spring runoff. Present plans call for the monitoring of this data in real time for two years.
